                                                                                                                                                                                                                                                                                                                                                                                                     J. Biochem. 224:923-930(1994).

J. Biochem. 224:923-930(1994).

FUNCTION: SHOWS ACTIVITY ON LICHENAN, BETA-GLUCAN AND LAMINARIN BUT NOT ON CMC CELLULOSE OR XYLAN. THE ENZYME HAS A TEMPERATURE OPTIMUM OF 85 DEGREES CELSIUS AND A PH OPTIMUM OF 7.0.

CATALYTIC ACTIVITY: Hydrolysis of 1,4-beta-D-glycosidic linkages in beta-D-glucans containing 1,3- and 1,4-bonds.

SIMILARITY: BELONGS TO FAMILY 16 OF GLYCOSYL HYDROLASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                œ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  deduced from a gene sequence isolated from genomic DNA using PCR primers (see AAX59180-91) based on conserved motifs (see AAY06325-29) of Trichoderma reesei EGIII cellulase and related enzymes. PCR has been used to identify novel EGIII-like enzymes, including the present protein, from bacterial and fungal sources (see AAY06331-70). The sequence shows homology to T. resei EGIII (see AAY06331). Also provided by the invention are vectors, host cells and methods for the recombinant production of such enzymes, which can be used in the treatment of cellulose-containing textiles, as feed additives, in the treatment of wood pulp, in the reduction of biomass to glucose, in the stone washing of indigo dyed denim, or as laundry detergent components (all claimed).
    Example 1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is a cellulase related to endoglucanase III (EGIII) from Trichoderma reesei. EGIII-like genes were isolated from genomic DNA libraries constructed from various microorganisms by PCR. The isolated genes showed significant homology to EGIII from T. reesei. Certain substitution and deletion mutations have been incorporated into EGIII and EGIII-like cellulases to produce variant enzymes with improved stability, e.g. increased resistance to temperature stress. The mutants may be used in textile and wood pulp treatment, as a feed additive, and for reducing biomass to glucose. They are also useful for stonewashing or indigo dyed denim and as an agent in laundry and dish detergents.
                 Novel variant endoglucanase III-like cellulases with improved surfactant stability and resistance to temperature stress, use textile processing or cleaning, treating wood pulp, food and greducing biomass to glucose .

The variant cellulases and compositions containing them are used in textile processing or cleaning, e.g. stonewashing of indigo dyed denim, and modifying the texture, feel or appearance of cellulose containing fabrics (e.g. improving fabric smoothness or removing pills and fibrils). The compositions may also be used for the removal of immature or dead cotton from cellulosic fibres or fabric, which can cause uneven dying. The cellulase may also be used in a detergent composition for washing laundry and dishes and in the treatment of animal feed, wood pulp, paper, non-animal foods and grains. The enzymes may also be used in the reduction of biomass to glucose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents an endoglucanase III (EGIII)-like cellulase. The cellulase has homology to the Trichoderma reesei EGII protein. The variant cellulases have improved temperature stability,
                                                                                                                                                                                                      Bower

It was deduced from a partial gene sequence isolated from genomic DNA using PCR primers (see AAY06325-29) based on conserved motifs (see AAY06325-29) of Trichoderma reesei EGIII cellulase and related enzymes. PCR has been used to identify novel EGIII-like enzymes, including the present polypeptide, from bacterial and fungal sources (see AAY06331-70). Also provided by the invention are vectors, host cells and methods for the recombinant production of such enzymes, which can be used in the treatment of cellulose-containing textiles,
           The present polypeptide represents a full-length sequence of a novel EGIII-like cellulase of Streptomyces sp. 11AG8. It was deduced from a gene sequence isolated from genomic DNA using PCR primers (see AAX59180-91) based on conserved motifs (see AAY06325-29) of Trichoderma reesei EGIII cellulase and related enzymes. PCR has been used to identify novel EGIII-like enzymes, including the present protein, from bacterial and fungal sources (see AAY06331-70). The sequence shows homology to T. reesei EGIII (see AAY06330). Also provided by the invention are vectors, host cells and methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     as feed additives, in the treatment of wood pulp, in the reductic of biomass to glucose, in the stone washing of indigo dyed denim, or as laundry detergent components (all claimed).

The present sequence is a cellulase related to endoglucanase III (EGIII) from Trichoderma reesei. EGIII-like genes were isolated from genomic DNA libraries constructed from various microorganisms by PCR. The isolated genes showed significant homology to EGIII from T. reesei. Certain substitution and deletion mutations have been incorporated into EGIII and EGIII-like cellulases to produce variant enzymes with improved stability, e.g. increased resistance to temperature stress. The mutants may be used in textile and wood pulp treatment, as a feed additive, and for reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              fabrics, including removal or immature or the desired as baking additing treating starch (in production of high-fructose corn syrup or treating starch (in production of high-fructose corn syrup or ethanol) and for treating grain (to reduce fibre during milling).
                                                                                                                                                                 Novel endoglucanase III or endoglucanase III-like cellulase useful for treating textiles and wood pulp comprises a substitution or deletion as specified positions in the wild form of endoglucanase III
